Netflix Data Science Project

In [ ]:

```

```

In [ ]:

```

```

1. Environment Setup and Data Loading

In this section, we import the necessary libraries for data manipulation (`pandas` , `numpy`) and visualization (`seaborn` , `matplotlib`). We also load the raw Netflix dataset.

In [273]:

```
import pandas as pd
import seaborn as sns
import matplotlib.pyplot as plt
import numpy as np

from warnings import filterwarnings
filterwarnings("ignore")

df = pd.read_csv("dataset/Netflix.csv")
```

2. Initial Data Inspection

Before cleaning, we take a quick look at the first few rows of the data, its dimensions, and the data types of each column to identify potential issues.

In [274]:

```
df.head()
```

Out[274]:

	show_id	type	title	director	cast	country	date_added	release_year	rating	duration	genres

```

3. Data Cleaning

To ensure the quality of our analysis, we perform the following:

- **Drop Unnecessary Columns:** Removing `show_id` as it serves only as a unique identifier.
- **Impute Missing Values:** Filling gaps in `director`, `cast`, and `country` with "Unknown", and using the mode for `rating` and `date_added`.

In [280]:

```
df.drop(columns=['show_id'], inplace=True)
```

In [281]:

```
df['director'].fillna('Unknown', inplace=True)
df['cast'].fillna('Unknown', inplace=True)
```

```
df['country'].fillna('Unknown', inplace=True)
df['rating'].fillna(df['rating'].mode()[0], inplace=True)
df['date_added'].fillna(df['date_added'].mode()[0], inplace=True)
```

In [ ]:

```

```

4. Feature Engineering

We create new features to extract more value from the existing data:

1. **Date Extraction:** Converting `date_added` to datetime objects to extract year and month.
2. **Complexity Metrics:** Calculating the number of cast members and genres per title.
3. **Categorization:** Simplifying the content ratings into broader categories: **Adult**, **Teen**, and **Kids**.
4. **Localization:** Extracting the primary country of origin from the `country` column.

In [282]:

```
df['date_added'] = pd.to_datetime(df['date_added'])

df['year_added'] = df['date_added'].dt.year
df['month_added'] = df['date_added'].dt.month
```

In [283]:

```
df.drop(columns=['date_added'], inplace=True)
```

In [284]:

```
df['cast_count'] = df['cast'].apply(lambda x: len(x.split(',')))
df['genre_count'] = df['genres'].apply(lambda x: len(x.split(',')))
```

In [285]:

```
df['duration_type'] = df['type']

df.rename(columns={'duration':'duration_value'}, inplace=True)
```

In [286]:

```
df['country_main'] = df['country'].apply(lambda x: x.split(',')[0])
```

In [287]:

```
def simplify_rating(r):
    if r in ['TV-MA','R','NC-17']:
        return "Adult"
    elif r in ['PG-13','TV-14']:
        return "Teen"
    else:
        return "Kids"

df['rating_category'] = df['rating'].apply(simplify_rating)
```

In [288]:

```
df.drop(columns=['rating'], inplace=True)
```

5. Exploratory Data Analysis & Visualization

With the data cleaned and enriched, we now move to the visualization phase. This help us identify:

- **The distribution of content types (Movies vs. TV Shows).**
- **Trends in content releases over the years.**
- **Relationship between content duration and its category.**

- **Relationship between content duration and its category.**

In [289]:

```
sns.countplot(x="type",data=df)
plt.show()
```

In [290]:

```
sns.countplot(y="month_added",data=df)
plt.show()
```

In [291]:

```
plt.figure(figsize=(10,5))
sns.countplot(y=df["year_added"])
plt.show()
```

In [ ]:

In [ ]:

In [292]:

```

🎯 Decision Tree for Netflix Content Type Prediction

The decision tree model was trained to classify Netflix content into Movies and TV Shows using features such as:

- `release_year`

- `country_encoded`
- `cast_count`

🔍 Model Insights

- **The tree splits primarily on release year, showing that newer releases tend to follow different classification patterns than older ones.**
- **Country encoding and cast count act as secondary features, refining predictions when year alone is insufficient.**
- **Leaf nodes reveal the final classification outcome, with color-coding distinguishing between predicted classes.**

📊 Performance

- **Accuracy: ~0.706 (≈71%)**
- **This indicates the model correctly classifies about 7 out of 10 titles.**
- **While interpretable and easy to visualize, the decision tree may suffer from overfitting and limited generalization compared to ensemble methods.**

🧠 Key Takeaway

The decision tree provides a transparent view of how Netflix content is classified, highlighting the importance of release year as the dominant feature. However, for higher accuracy and robustness, ensemble approaches (e.g., Random Forests, Gradient Boosting) would likely outperform this single-tree model.

In [306]:

```
# 1. Create a DataFrame to hold the feature names and their corresponding importance scor
es
feature_importance_df = pd.DataFrame({
    'Feature': feature_cols,
    'Importance': model.feature_importances_
}).sort_values(by='Importance', ascending=True)

# 2. Plot the Feature Importance
plt.figure(figsize=(10, 6))
plt.barh(feature_importance_df['Feature'], feature_importance_df['Importance'], color='re
d')

plt.title('Feature Importance for Netflix Content Type Prediction', fontsize=16)
plt.xlabel('Importance Score', fontsize=12)
plt.ylabel('Features', fontsize=12)
plt.grid(axis='x', linestyle='--', alpha=0.7)

plt.show()

# 3. Print the values for reference
# Create the sorted dataframe and drop the old index
importance_display = feature_importance_df.sort_values(by='Importance', ascending=False)
.reset_index(drop=True)

# Display the clean table
importance_display.reset_index()
```

Out[306]:

	index	Feature	Importance
0	0	country_encoded	0.542345
1	1	release_year	0.302328
2	2	cast_count	0.155326

Q3] Which countries dominate Netflix content, and how does the Movie vs TV-Show ratio change across the top 10 countries?

In [307]:

```
top10_countries = df['country_main'].value_counts().head(10).index
country_type = df[df['country_main'].isin(top10_countries)].groupby(['country_main', 'ty
pe']).size().unstack()
country_type.plot(kind='bar', stacked=True, figsize=(12,6))
plt.title('Movie vs TV Show Distribution by Top 10 Countries')
plt.show()
```

Q4] Do titles with a known director have significantly higher cast_count, genre_count, or longer duration than “Unknown” director titles?

In [308]:

```
df.groupby('has_director')[['cast_count', 'genre_count', 'duration_value']].mean().round
(2)
sns.barplot(x='has_director', y='duration_value',hue="has_director", data=df)
plt.legend(title="Has director (1-> Yes , 0-> No)) ")
plt.show()
```

In [309]:

```
df.head()
```

Out[309]:

	type	title	director	cast	country	release_year	duration_value	genres	description	year_added

Q5] Develop a Content- recommendation system:

In [310]:

```
import pandas as pd
import pickle
import numpy as np
from nltk.corpus import stopwords

from nltk.tokenize import word_tokenize
from gensim.models import Word2Vec
from sklearn.metrics.pairwise import cosine_similarity

# ----------------------------
# STEP 1: Create tags (same as before)
# ----------------------------
df['tags'] = (
    df['title'].fillna('') + " " +
    df['genres'].fillna('') + " " +
    df['description'].fillna('') + " " +
    df['cast'].fillna('') + " " +
    df['director'].fillna('') + " " +
    df['country_main'].fillna('') + " " +
    df['rating_category'].fillna('') + " " +
    df['type'].fillna('')
)

df['tags'] = df['tags'].str.lower()

# ----------------------------
# STEP 2: Tokenization
# ----------------------------
stop_words = set(stopwords.words('english'))

df['tokens'] = df['tags'].apply(
    lambda x: [word for word in word_tokenize(x)
               if word.isalnum() and word not in stop_words]
)

# ----------------------------
# STEP 3: Train Word2Vec Model
# ----------------------------
w2v_model = Word2Vec(
    sentences=df['tokens'],
    vector_size=100,
    window=5,
    min_count=1,
    workers=4
)

# ----------------------------
# STEP 4: Convert each content into vector
# ----------------------------
def get_doc_vector(tokens):
    vectors = []
    for word in tokens:
        if word in w2v_model.wv:
            vectors.append(w2v_model.wv[word])
```

```python
    if len(vectors) == 0:
        return np.zeros(100)

    return np.mean(vectors, axis=0)

df['vector'] = df['tokens'].apply(get_doc_vector)

# Convert to matrix
vectors = np.vstack(df['vector'].values)

# ----------------------------
# STEP 5: Recommendation Class
# ----------------------------
class RecommendationModel:
    def __init__(self, vectors, df, w2v_model):
        self.vectors = vectors
        self.df = df.reset_index(drop=True)
        self.w2v_model = w2v_model

    def text_to_vector(self, text):

Q6] Can we forecast how many titles Netflix will add in 2022–2025?

In [311]:

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt

from sklearn.model_selection import train_test_split
from sklearn.metrics import r2_score, mean_absolute_error

yearly_data = df.groupby(['year_added','genre_count']).size().reset_index(name='title_co
unt')
yearly_data = yearly_data[yearly_data['year_added'] <= 2021]
```

```
X = yearly_data[['year_added','genre_count']]
y = yearly_data['title_count']

X_train, X_test, y_train, y_test = train_test_split(
    X, y, test_size=0.2, random_state=42
)

future_years = pd.DataFrame({
    'year_added': [2022, 2023, 2024, 2025],
    'genre_count': [yearly_data['genre_count'].mean()] * 4
})
```

a) Linear Regression:

In [312]:

```
from sklearn.pipeline import Pipeline
from sklearn.preprocessing import StandardScaler, PolynomialFeatures
from sklearn.linear_model import LinearRegression

linear_pipeline = Pipeline([
    ('scaler', StandardScaler()),
    ('poly', PolynomialFeatures(degree=1)),
    ('model', LinearRegression())
])

linear_pipeline.fit(X_train, y_train)

y_pred_linear = linear_pipeline.predict(X_test)
linear_forecast = linear_pipeline.predict(future_years)
```

b) Adaboost:

In [313]:

```
from sklearn.ensemble import AdaBoostRegressor
from sklearn.tree import DecisionTreeRegressor

ada_pipeline = Pipeline([
    ('model', AdaBoostRegressor(
        estimator=DecisionTreeRegressor(max_depth=3),
        n_estimators=100,
        learning_rate=0.5,
        random_state=42
    ))
])

ada_pipeline.fit(X_train, y_train)

y_pred_ada = ada_pipeline.predict(X_test)
ada_forecast = ada_pipeline.predict(future_years)
```

c) Decision tree:

In [314]:

```
from sklearn.tree import DecisionTreeRegressor

tree_pipeline = Pipeline([
    ('model', DecisionTreeRegressor(
        max_depth=3,
        random_state=42
    ))
])
```

```
tree_pipeline.fit(X_train, y_train)

y_pred_tree = tree_pipeline.predict(X_test)
tree_forecast = tree_pipeline.predict(future_years)
```

d) Extratrees:

In [315]:

```

CONCLUSION]

Tree-based models such as DecisionTreeRegressor, ExtraTreesRegressor, AdaBoostRegressor, and GradientBoostingRegressor achieved high accuracy on test data, with Gradient Boosting giving the best performance in terms of R^2 score and MAE.

Conclusion: Forecasting Netflix Titles (2022–2025)

After comparing regression models, we see a wide divergence in forecasts:

- **Linear Regression** projects steady growth, from ~536 titles in 2022 to ~677 titles in 2025.
- **AdaBoost, Decision Tree, Extra Trees, SVR, and Gradient Boosting** remain nearly flat, predicting between 25–39 titles per year, showing limited sensitivity to historical trends.

Projected Titles Added (2022–2025)

Based on the table of model outputs:

Year	Linear	AdaBoost	Decision Tree	Extra Trees	SVR	Gradient Boosting
2022	536	39	28	177	28	39
2023	583	39	28	177	27	39
2024	630	39	28	177	26	39
2025	677	39	28	177	25	39

Key Takeaway

- **Linear Regression** suggests Netflix will continue adding **~140 more titles over 4 years**, reaching ~677 by 2025.
- Other models (AdaBoost, SVR, Gradient Boosting) predict **minimal growth**, essentially flatlining around 25–40 titles annually.
- **Extra Trees** sits in between, holding steady at ~177 titles per year.

Overall, the **Linear Regression model provides the most realistic growth trajectory** , while the others appear underfit or overly constrained. If we trust the linear trend, Netflix's catalog expansion will be moderate but consistent through 2025.

```

In [ ]:

```

```

Q7] How is Netflix content growing over time?

In [320]:

```
data = df["year_added"].value_counts().reset_index()
data = data.head(5)
sns.barplot(x=data["year_added"],y=data["count"])

plt.show()
```

In [ ]:

```

```

In [321]:

```
yearly_data.sort_values(by="title_count",ascending=False).head(5)
```

Out[321]:

	year_added	genre_count	title_count
30	2019	3	954
33	2020	3	841
29	2019	2	758
27	2018	3	753
32	2020	2	735

CONCLUSION] Netflix content has shown a consistent upward trend over the years, with significant growth in recent years. Linear models were able to capture this trend effectively, while tree-based models failed due to their inability to extrapolate beyond training data. This highlights the importance of selecting models based on problem type rather than complexity.

Q8] Who are the top contributing directors?

Q8] Who are the top contributing directors?

In [322]:

```
data = df["director"].value_counts().reset_index().head()
data = data[data["director"]!="Unknown"]
data
```

Out[322]:

	director	count
1	Raúl Campos, Jan Suter	18
2	Marcus Raboy	16
3	Jay Karas	14
4	Cathy Garcia-Molina	13

CONCLUSION] The top contributing directors include:

1) Raúl Campos 2) Jan Suter 3) Marcus Raboy 4) Jay Karas 5) Cathy Garcia-Molina

In [ ]:

```

```

Q9] Which countries contribute most to the content-library?

In [323]:

```
data = df["first_country"].value_counts().reset_index().head()
data = data[data["first_country"]!="Unknown"]
data
```

Out[323]:

	first_country	count
0	United States	2883
1	India	956
2	United Kingdom	577
4	Canada	259

CONCLUSION] The top contributing countries are:

1) United States 2) India 3) United Kingdom 4) Canada

```

Q10] Is there a statistically significant difference in the average duration of Netflix content between Movies and TV Shows?

In [324]:

```
from scipy.stats import ttest_ind
```

```
# Split data into two groups
movies = df[df['type'] == 'Movie']['duration_value']
tv_shows = df[df['type'] == 'TV Show']['duration_value']

# Perform Independent T-Test
t_stat, p_value = ttest_ind(movies, tv_shows, equal_var=False)

# Print results
print("T-Statistic:", t_stat)
print("P-Value:", p_value)

# Decision
alpha = 0.05

if p_value < alpha:
    print("\nReject Null Hypothesis (H0)")
    print("There is a statistically significant difference in duration.")
else:
    print("\nFail to Reject Null Hypothesis (H0)")
    print("No significant difference in duration.")
```

```
T-Statistic: 249.79900942857398
P-Value: 0.0

Reject Null Hypothesis (H0)
There is a statistically significant difference in duration.
```

CONCLUSION] There is a significant difference in the durations of tv-shows and movies.

In [ ]:

```

```

Q11] Is the proportion of TV Shows significantly higher in recent years (after 2018) compared to older years?

In [325]:

```
import pandas as pd
import numpy as np
from statsmodels.stats.proportion import proportions_ztest

# Create groups
recent = df[df['release_year'] >= 2018]
old = df[df['release_year'] < 2018]

# Count TV shows
success_recent = (recent['type'] == 'TV Show').sum()
success_old = (old['type'] == 'TV Show').sum()

# Total samples
n_recent = len(recent)
n_old = len(old)

# Z-test
count = np.array([success_recent, success_old])
nobs = np.array([n_recent, n_old])

z_stat, p_value = proportions_ztest(count, nobs, alternative='larger')

print("Z-stat:", z_stat)
print("P-value:", p_value)

# Decision
alpha = 0.05
if p_value < alpha:
```

```
    print("Reject H0: TV Shows proportion increased in recent years")
else:
    print("Fail to Reject H0")
```

```
Z-stat: 17.28945184862103

Q13] Which genres are overcrowded vs underserved?

In [328]:

```
from collections import Counter

new_df = df.copy()
new_df['genre_list'] = new_df['genres'].apply(lambda x: x.split(','))

all_genres = [g.strip() for sublist in new_df['genre_list'] for g in sublist]

genre_counts = Counter(all_genres)

genre_df = pd.DataFrame(genre_counts.items(), columns=['genre', 'count'])
genre_df = genre_df.sort_values(by='count', ascending=False)
```

In [329]:

```
print("Overcrowded genres:")
genre_df.head(10)
```

```
Overcrowded genres:
```

Out[329]:

	genre	count
4	International Movies	2437
6	Dramas	2106
8	Comedies	1471
0	International TV Shows	1199
15	Documentaries	786
13	Action & Adventure	721
1	TV Dramas	704
12	Independent Movies	673
21	Children & Family Movies	532
14	Romantic Movies	531

In [330]:

```
print("Underserved genres:")
genre_df.tail(10)
```

```
Underserved genres:
```

Out[330]:

	genre	count
38	TV Horror	69
36	Teen TV Shows	60
37	Cult Movies	59
23	Faith & Spirituality	57
41	Anime Features	57
26	Movies	56
35	Stand-Up Comedy & Talk Shows	52
33	TV Thrillers	50
40	Classic & Cult TV	27
20	TV Shows	12

Q14] How has content production evolved over time?

In [331]:

```
import matplotlib.pyplot as plt

df['release_year'] = pd.to_numeric(df['release_year'], errors='coerce')

yearly = df.groupby('release_year').size()

yearly.plot(kind='line')
plt.title("Content Production Over Time")
plt.xlabel("Year")
plt.ylabel("Count")
plt.show()
```

CONCLUSION] With this we can say that most content-addition was done between the years 2000 and 2020.
