Netflix Data Analysis and Visualization Project

Introduction

This notebook performs a comprehensive Exploratory Data Analysis (EDA) on a Netflix dataset. The goal is to uncover trends in content creation, understand distribution across countries, and categorize content for better insights.

Steps covered:

1. **Data Cleaning:** Handling missing values and duplicates.
2. **Feature Engineering:** Creating new metrics like `year_added`, `cast_count`, and `rating_category`.
3. **Exploratory Analysis:** Statistical summaries and visual inspections.

```

```

In [ ]:

```

```

1. Environment Setup and Data Loading

In this section, we import the necessary libraries for data manipulation (`pandas`, `numpy`) and visualization (`seaborn`, `matplotlib`). We also load the raw Netflix dataset.

In [412]:

```
import pandas as pd
import seaborn as sns
import matplotlib.pyplot as plt
import numpy as np

from warnings import filterwarnings
filterwarnings("ignore")

df = pd.read_csv("dataset/Netflix.csv")
```

2. Initial Data Inspection

Before cleaning, we take a quick look at the first few rows of the data, its dimensions, and the data types of each column to identify potential issues.

In [413]:

```
df.head()
```

Out[413]:

	show_id	type	title	director	cast	country	date_added	release_year	rating	duration	genres

```

In [418]:

```
df.duplicated().sum()
```

Out[418]:

```
np.int64(0)
```

3. Data Cleaning

To ensure the quality of our analysis, we perform the following:

- **Drop Unnecessary Columns:** Removing `show_id` as it serves only as a unique identifier.
- **Impute Missing Values:** Filling gaps in `director`, `cast`, and `country` with "Unknown", and using the mode for `rating` and `date_added`.

In [419]:

```
df.drop(columns=['show_id'], inplace=True)
```

In [420]:

```
df['director'].fillna('Unknown', inplace=True)
df['cast'].fillna('Unknown', inplace=True)
df['country'].fillna('Unknown', inplace=True)
df['rating'].fillna(df['rating'].mode()[0], inplace=True)
df['date_added'].fillna(df['date_added'].mode()[0], inplace=True)
```

4. Feature Engineering

We create new features to extract more value from the existing data:

1. **Date Extraction:** Converting `date_added` to datetime objects to extract year and month.
2. **Complexity Metrics:** Calculating the number of cast members and genres per title.
3. **Categorization:** Simplifying the content ratings into broader categories: **Adult**, **Teen**, and **Kids**.
4. **Localization:** Extracting the primary country of origin from the `country` column.

In [421]:

```
df['date_added'] = pd.to_datetime(df['date_added'])

df['year_added'] = df['date_added'].dt.year
df['month_added'] = df['date_added'].dt.month
```

In [422]:

```
df.drop(columns=['date_added'], inplace=True)
```

In [423]:

```
df['cast_count'] = df['cast'].apply(lambda x: len(x.split(',')))
df['genre_count'] = df['genres'].apply(lambda x: len(x.split(',')))
```

In [424]:

```
df['duration_type'] = df['type']

df.rename(columns={'duration':'duration_value'}, inplace=True)
```

In [425]:

```
df['country_main'] = df['country'].apply(lambda x: x.split(',')[0])
```

In [426]:

```
def simplify_rating(r):
    if r in ['TV-MA','R','NC-17']:
        return "Adult"
    elif r in ['PG-13','TV-14']:
        return "Teen"
    else:
        return "Kids"

df['rating_category'] = df['rating'].apply(simplify_rating)
```

In [427]:

```
df.drop(columns=['rating'], inplace=True)
```

5. Exploratory Data Analysis & Visualization

With the data cleaned and enriched, we now move to the visualization phase. This help us identify:

- **The distribution of content types (Movies vs. TV Shows).**
- **Trends in content releases over the years.**
- **Relationship between content duration and its category.**

In [428]:

```
sns.countplot(x="type",data=df)
plt.show()
```

In [429]:

```
sns.countplot(y="month_added",data=df)
plt.show()
```

In [430]:

```
