```

Q2] Netflix wants to check whether the average duration of Movies is different from the average duration of TV Shows in its catalog. Use an appropriate statistical test to determine if the difference is significant.

In [99]:

```
avg_movie_duration = df[df["type"]=="Movie"]["duration"]
avg_tv_show_duration = df[df["type"]=="TV Show"]["duration"]

from scipy import stats

t_stat, p_val = stats.ttest_ind(avg_movie_duration, avg_tv_show_duration,equal_var=False)

alpha = 0.05
if p_val < alpha:
```

```
    print("Reject null hypothesis: Significant difference found.")
else:
    print("Fail to reject null hypothesis: No significant difference.")
```

```
Reject null hypothesis: Significant difference found.
```

In [ ]:

```

```

Q3] Netflix claims that the average duration of newly released content (after 2020) is 100 minutes. Using the available data, test whether the average duration is actually less than 100 minutes at a 5% significance level.

In [100]:

```
from statsmodels.stats.weightstats import ztest

new_content = df[
    (df["release_year"] > 2020)
]["duration"].dropna()

population_mean = 100
alpha = 0.05

z_stat, p_value = ztest(new_content, value=population_mean)

p_value = p_value / 2 if z_stat < 0 else 1 - p_value / 2

print(f"Z-Score = {z_stat:.4f}, P-Value = {p_value:.4f}")

if p_value < alpha:
    print("Reject H0: Average duration is significantly less than 100 minutes.")
else:
    print("Fail to reject H0: No evidence that average duration is less than 100.")
```

```
Z-Score = 5.1466, P-Value = 1.0000
Fail to reject H0: No evidence that average duration is less than 100.
```

In [ ]:

```

```

Q4] Netflix wants to segment its content library to improve recommendation systems and optimize content investment strategy.

In [101]:

```
import matplotlib.pyplot as plt
import pandas as pd
from sklearn.preprocessing import StandardScaler
from sklearn.decomposition import PCA
from sklearn.cluster import KMeans

feature_cols = [
    "duration",
    "genre_count",
    "cast_count",
    "country_count",
    "description_length",
    "release_year"
]

X = df[feature_cols].copy()

scaler = StandardScaler()
```

```python
X_scaled = scaler.fit_transform(X)

pca = PCA(n_components=2)
X_pca = pca.fit_transform(X_scaled)

inertias = []
k_values = range(2, 11)

for k in k_values:
    kmeans = KMeans(n_clusters=k, random_state=42, n_init=10)
    kmeans.fit(X_scaled)
    inertias.append(kmeans.inertia_)

plt.figure(figsize=(8, 5))
plt.plot(k_values, inertias, marker='o')
plt.xlabel("Number of Clusters (k)")
plt.ylabel("Inertia")
plt.title("Elbow Method for Optimal k")
plt.show()

optimal_k = 5
kmeans = KMeans(n_clusters=optimal_k, random_state=42, n_init=10)
clusters = kmeans.fit_predict(X_scaled)

df["cluster"] = clusters

cluster_profile = df.groupby("cluster")[feature_cols].mean().round(2)
print("Cluster Profile:\n")
print(cluster_profile)

cluster_names = {
    0: "Classic Long-Form Rich Content",
    1: "Moderate-Length Simple Recent Content",
    2: "Global Long-Form Rich Content",
    3: "Quick Consumption Content",
    4: "Modern Long-Form Content"
}

df["cluster_label"] = df["cluster"].map(cluster_names)

cluster_sizes = (
    df.groupby(["cluster", "cluster_label"])
      .size()
      .reset_index(name="count")
      .sort_values("cluster")
)

print("\nCluster Sizes:\n")
print(cluster_sizes)

plt.figure(figsize=(10, 7))

for i in range(optimal_k):
    plt.scatter(
        X_pca[clusters == i, 0],
        X_pca[clusters == i, 1],
```

```
        label=cluster_names[i],
        alpha=0.7
    )

plt.xlabel("Content Structure / Scale")
plt.ylabel("Global & Descriptive Content")
plt.title("Netflix Content Clusters (PCA Reduced)")
plt.legend()
plt.show()
```

```

4        4               Modern Long-Form Content   3132
```

In [102]:

```
pca_df = pd.DataFrame(
    pca.components_,
    columns=feature_cols,
    index=["PC1", "PC2"]
)

print(pca_df)
```

```
     duration  genre_count  cast_count  country_count  description_length  \
PC1  0.551497     0.395531    0.474079       0.320384            0.096749
PC2 -0.320656     0.615081    0.439104      -0.262664           -0.373546

     release_year
PC1     -0.450167
PC2      0.342804
```

In [103]:

```
from sklearn.metrics import silhouette_score

for k in range(2, 10):
    kmeans = KMeans(n_clusters=k, random_state=42, n_init=10)
    labels = kmeans.fit_predict(X_scaled)
    print(f"k={k}, silhouette={silhouette_score(X_scaled, labels):.3f}")
```

```
k=2, silhouette=0.190
k=3, silhouette=0.205
k=4, silhouette=0.229
k=5, silhouette=0.253
k=6, silhouette=0.255
k=7, silhouette=0.263
k=8, silhouette=0.260
k=9, silhouette=0.231
```

we got best silhoette score at 5-7 (mostly the same) but still we will go with no. of clusters as 4 because at k=5 and 6 most of the clusters were overlapping and the data doesnt naturally support this.
